

# Suggestions-IEGC

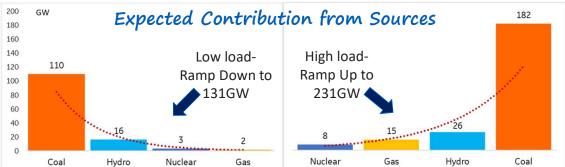

# Grid Stability - Using existing coal units for flexible operation

## Flexible Power Projected Net Load Curve -2022 & Options

#### Options to support flexibility

- Gas Low fuel gas availability; potential use of ~14GW of stranded asset for RE integration
- Hydro-Limited Pump Storage <5GW.</li>
   Constraints of water availability, downstream constraints & Agriculture needs etc.
- Nuclear Limited capacities
- Coal Expected & need to support ~70% of flex needs and most economical option
- Battery Good source, however no short term scale and economic viability

Limited & inadequate flex support Options - Coal must support max. flexibility needs

## Estimates of LCOE of battery storage

Please enter values in "BLUE" only

Batteries economically costlier option than using coal for flex support

## Economic Impact Assessment- Battery Vs. Coal flex.

#### **Assumptions**

- Capacity-38GW (4 hrs cycles -2 cycles/day)
- Battery-Cost 250\$/Kwh
- Coal units flex conversion- 20 lakh/Mw

For 40GW Rs Crore	Battery	<b>Coal Flexing Retrofit</b>	Saving Cr
CAPEX (Rs Cr)	243,750	12,400	231,350
OPEX	2,925	17,825	-14,900
Cost of Electricity Rs/Unit	Rs 8 to 8.5	Rs 4.7 to 6.5	
MU Generated	1	.09,500	
Total Cost	87,600	71,175	16,425

Coal units flexing is cheaper than battery storage.

All India Savings of ~16,000 Cr./year

### Recommendation

- > Flexing coal plants one of the most economical option to integrate renewable
- > Avoid coal plant closure and use them for flexible operations
  - ➤ Identify 50-60GW of coal plants & retrofit for flexible operations
- > Flex coal plant to minimum load of 30%
- ➤ Ramp rate 2% minimum for all plants
- ➤ Support implementation of AGC

## Boiler flexibility features – Low load

#### **Firing System**

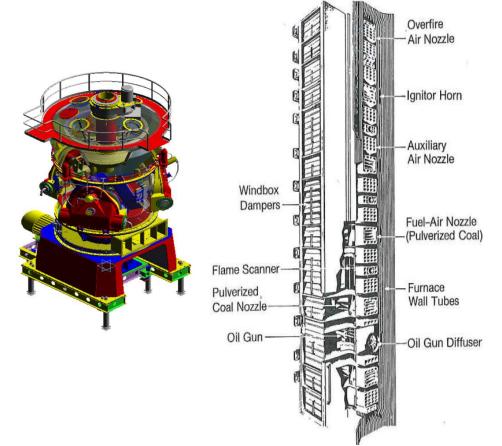

- Wind Box
- Coal & Air Nozzles
- Control Philosophy-SA & PA
- Mill Upgrades
- Advanced Flame Scanners
- Mill O/L Temp.
- Two Mill Operation
- Advance Tilt Mechanism

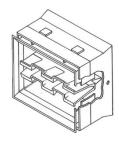

#### **Pressure Parts**

- RH / SH Modification
- Second Pass Modification

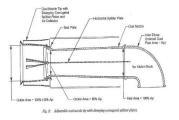

#### **Boiler Operation**

- Modify to Sliding Pressure
- Excess air level and burner tilts
- Preferential selection of burner elevation(s)

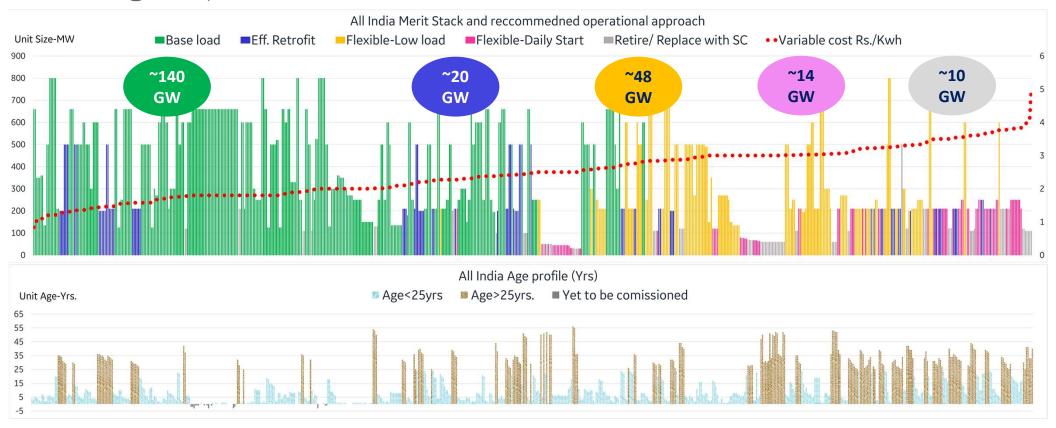

#### Boiler modifications for low load and cyclic operations

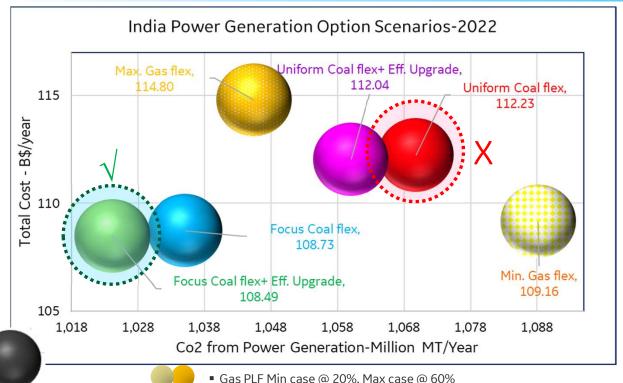

# Adopting Single National Merit order Approach & with flexing only focused selected coal units-2022

## Flexibility Support - 2022 All India Cost & Carbon scenarios

Current Cost-88.5 \$B/year Co2-937 MMT/year

- Gas PLF Min case @ 20%, Max case @ 60%
- Uniform coal flex: All coal units flexing
- Efficiency Upgrade: HR benefits from 8% (500MW) to 13% (for 210MW)
- Focus flex: Flex Sub-critical <500MW; higher size/SC used for base load
- Focus Flex + Efficiency Upgrade

#### Notes & Assumptions

- IB: 479GW per National Electricity Plan (NEP)
- Generation: 1698 BU per NEP
- Coal Retirement: 23GW per NEP
- Analysis of generation cost; no T&D costs
- Co2 Emissions: using CEA references

#### Generation Mix Base Case

- Constant generation from RE/NUC/Hydro
- Gas IB in NEP is 25GW, 38% PLF
- Coal generation 1072BU, per NEP; IB of 212GW

#### Coal Upgrades

- Efficiency Upgrade of 18GW at \$72MM/GW
- Flex Upgrade of 55GW at \$36MM/GW
- Impact on Flex O&M/Efficiency is factored in

Focus Flex~3.7 B\$/yr. savings ..~45 MMT Co2/yr. reduction in comparison with uniform flex

### Successful Global References

#### Low Load-Reference: 800 MW in Germany (Heilbronn)

- Coal fired unit, COD in 1985
- Tower type

Design Low load operation: 30%.

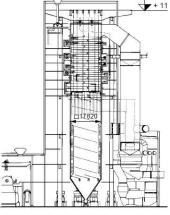

• 2012/13: Target Low Load operation: 15%;

Achieved: 10% (net) equivalent to ~15% (gross)

#### **Main Modifications**

- Mills: Upto One mill operation
- Boiler: Additional flame scanners per burner elevation
- Modification of unit I&C system

Summary Post Modifications	Full Load	Min. Load		
Main steam temperature	540	505		
Reheat steam temperature	540	467		
Heat input	100%	14%		
Boiler efficiency	94%	92%		
W/S cycle efficiency	45.7%	38%		
Generator power output [MW]	812	105		
Auxiliary power consumption [MW]	38	27		
Net power output [MW]	774 (100%)	(10%)		
Net efficiency	41%	26%		

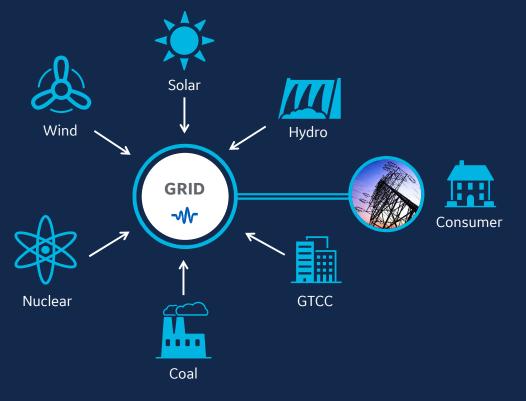

# Reactive Power Management -

Utilizing Retired / Retiring units by converting to Synchronous Condenser

## Addressing rising needs for grid performance enhancement

Synchronous Condensers addressing market needs

© 2019 General Electric Company - All rights reserved

#### **Evolving electricity mix**

- Increasing renewable share
- Thermal plant retirements
- Long HVDC transmission lines
- Transit markets

- Shrinking inertia
- Reduced short circuit strength
- Decreased dynamic reactive power reserves
- Grid System instability

#### **Market Requirements**

- Reactive power and voltage support
- Short circuit strength
- System inertia

Product Demand for Grid Performance enhancement reaching \$1.8b+ by 2020 (Global)

Synchronous Condensers

■ Power Electronics i.e. Static Compensators

#### Conversion of Thermal Unit to Synchronous Condenser

## Synchronous Condenser Conversion Benefits

#### Significant VAR capacity for reduced cost

Re-use of existing generator, auxiliaries, facility, step-up transformer,...

#### **Quickest overall cycle to implement**

Disconnect turbine, modify auxiliaries, install & integrate starter system

## Increased return on original plant investment

Avoid or delay mothball/demolition costs
Use available operation and maintenance expertese

#### Superior power system response

- Dynamic VARs
- · mass inertia (add flywheel as needed)

#### **Short circuit support**

 SC mechanical inertia provides increased short circuit capacity and thus improves grid stability where static capacitors and power electronics cannot

Investigate demand for grid stabilization where Steam Turbine trains are retired

#### Conversion of Thermal Unit to Synchronous Condenser Generator shaft line modifications

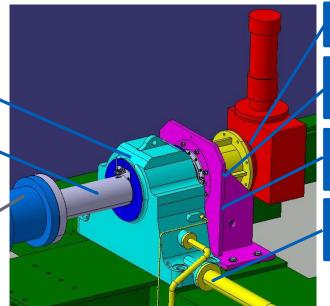

#### **Mechanical modifications required**

- Break turbine coupling.
   Move turbine coupling away from Generator coupling to allow for thermal expansion.
- Install thrust bearing as previous turbine thrust bearing is disconnected
- Optional LS turning gear incl. self synchronizing clutch depending on starting method and forecasted operational profile

Thrust bearing

Stub shaft

Existing
Exciter or
Generator
coupling

Turning gear (optional)

Clutch to disengage turning gear

Support for Turning gear & clutch

Lube oil mods for bearing & turning gear

#### **Considerations**

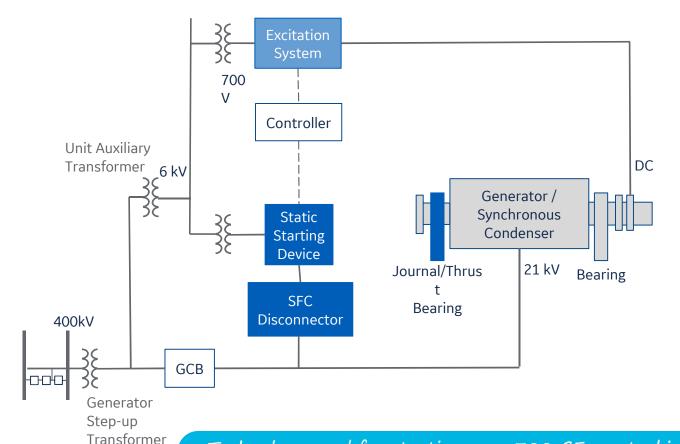

- Rotor dynamics assessment
- High pressure lift oil required?
- Add thrust bearing on NDE side (or alternatively modify existing Generator journal and bearing)
   Regulations for seismic loading

#### **Key benefits**

- External thrust bearing minimizes modification on Generator
- Modified Generator journal and bearing serves to minimizes losses and modifications on exciter end
- Low speed turning gear omits start-up vibration issues at low power consumption during stand-by

## Conversion of Thermal Unit to Synchronous Condenser Static Start

Synchronous condenser functions as motor for startup

#### **Modifications**

- Turbine disconnected
- Modify or upgrade excitation system
- Re-use existing auxiliary systems
- Mechanical modifications
- add thrust bearing
- add turning gear option
- Oil system modifications

#### **Considerations**

- Generator rotor must be equipped with slip rings
- SFC might be used barring
- One SFC can start multiple units

Technology used for starting over 700 GE gas turbine generators

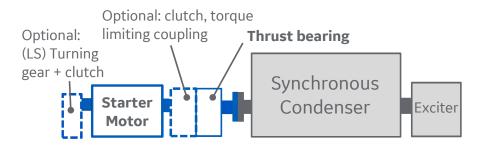

## Conversion of Thermal Unit to Synchronous Condenser Motor start

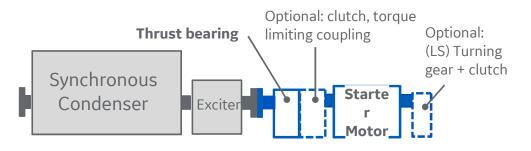

#### Maximize use of existing systems

- Motor ramps up Synchronous Condenser rotor to rated speed
- Re-use or upgrade existing excitation system
- Re-use existing plant auxiliary systems

#### **Motor on DE**

#### **Motor on NDE**

#### **Considerations**

- Rotor dynamic analysis required
- Space availability and foundation properties
- Motor on DE needs turbine to be removed
- Motor on NDE requires capability of exciter shaft joint
- For units with static excitation a static start configuration is likely less expensive

#### **Key benefits**

- Can be realized with static and brushless exciters
- Can possibly be integrated at DE and NDE side

## Competing Tech. & Economics

#### Comparison of Various Reactive Power Support Options

Equipment*	Ability to support Voltage*	Capital cost (per KVAr)*	Operating cost*	Opportunity Cost*	Category of Reactive power Support devices	Applications
STATCOM	Fair, drops with V	\$50-55	Moderate	NO	Dynamic Reactive Sources	Dynamic reactive
Static VAr compensator	Poor, above its rated value it drops with V <sup>2</sup>	\$45-50	Moderate	NO	Merits and Demerits:  These are fast, continuous & controllable reactive	resources are typically used to adapt to rapidly changing
Synchronous condenser	Excellent, additional short- term capacity	\$30-35	High	NO	support devices.  • Dynamic reactive devices can, on demand, increase	conditions on the transmission system, such
Generator	Excellent, additional short- term capacity	Difficult to separate	High	Yes	their output above the normal rating for short periods of time.  • Synchronous machines can produce several multiples of their normal reactive power rating for short periods.	as sudden loss of generators or transmission facilities.
Capacitor	Poor, drops with V <sup>2</sup>	\$8-10	Very low	NO	Static devices are ty adapt to slowly ch conditions such as dai load cycles and chang transactions.	anging system ly and seasonal

#### Converting retired unit to work as Synchronous Condenser is Economical

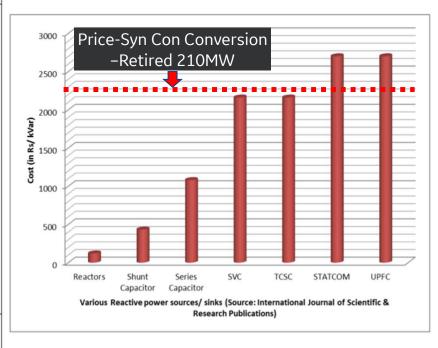

Figure 10 Average cost of Reactive power technologies

### Recommendation

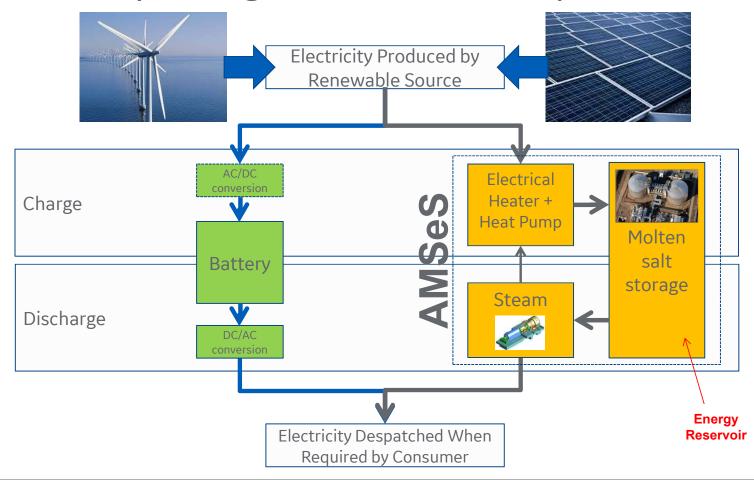

- > Synchronous condenser- Best suited to provide Dynamic reactive support.
- ➤ Better than SVC's, STATCOM in Inertial stability, LVRT, Short Crt. Strength etc.
- > For cheaper & faster support- Utilize retired/ retiring units & convert to Sycon
- > Forecast of Reactive needs- Study & analyze
- > Mechanism of valuation of reactive power support.
- > Develop & implement compensation/incentive mechanism.

# Explore Other Options-Thermal Energy Storage

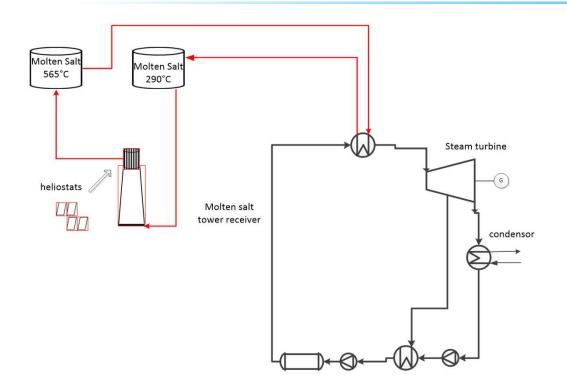

## Electricity Storage – The Thermal Option

# Molten Salt Storage and power cycle well known from tower based CSP

Molten Salt - experience, references, low cost - industrially well known (NaNO<sub>3</sub> + KNO<sub>3</sub>)

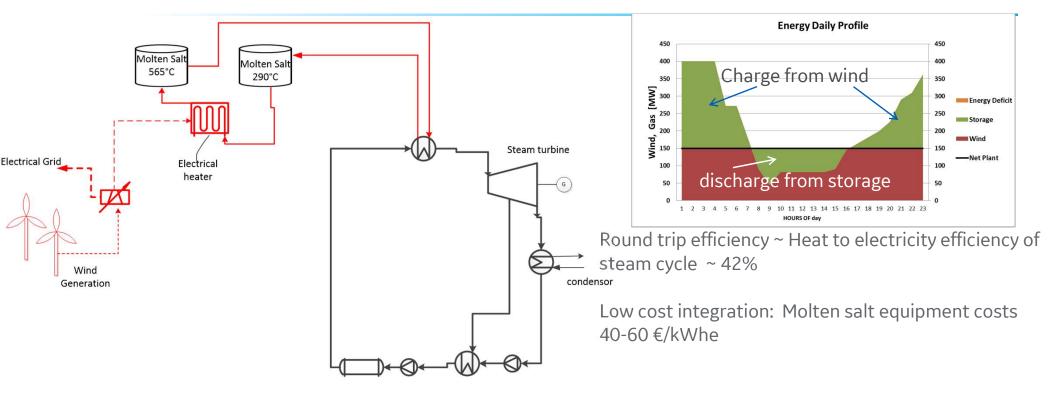

Well known 2-tank solution

60% NaNO<sub>3</sub> + 40% KNO<sub>3</sub> Non-toxic, used as fertilizer and in heat treatment for industry Stable upto 565°C, freezes at 240°C

# Direct electrical heating of molten salt from wind / Solar/ Grid

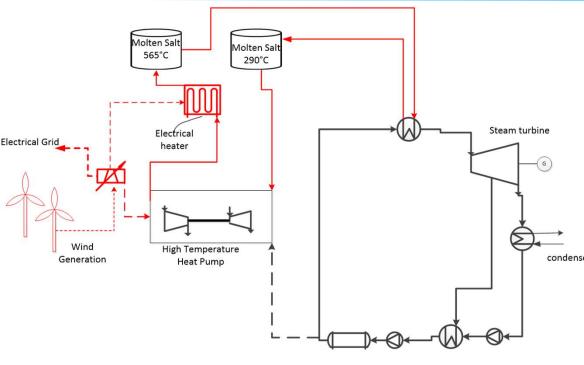

Electrical heater integration for 100 - 400 MW possible

## If business case demands -> better efficiency

#### High temperature heat pump based on GE equipment

Round trip efficiency ~ Coefficient of Performance of Heat pump x efficiency of steam cycle ~ 50%-52% net

Supercritical carbon dioxide used as working fluid for heat pump - equipment known in oil and gas industry

High temperature compressor is key enabling technology

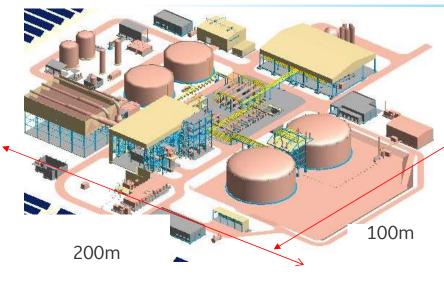

condenso Water tanks store hot water - extracted from steam cycle during discharge - increase heat pump efficiency during charge

GE patent: EP15153755

## Advantages and Features

No site dependance, lower footprint compared to Li-ion (for comparable size)

100 MWe - 8 -12 hours storage

- Limited space requirement (20 m2/ MWh) . Higher capacity up to 4-5 GWh possible by increasing tank size or simply more tanks
- No geographical constraint, no major earth moving
- Better lifetime than Li-ion batteries effectively no replacement during a 25-30 year lifetime
- Roundtrip efficiency in the range of 50% But low cost and scalability renders competitive
- Typical storage capacity from 4 to 24 hours

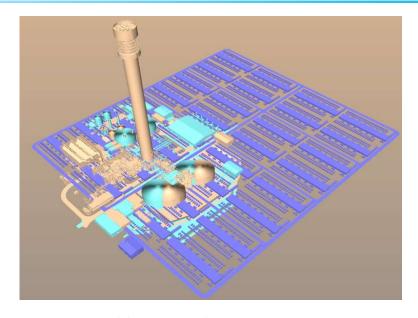

## AMSES – Advanced Molten Salt Electricity Storage

Energy and power density for large sizes is higher for AMSES than Li-ion

100 MW, 8 hrs storage with CO2 heat pumps and electrical heater

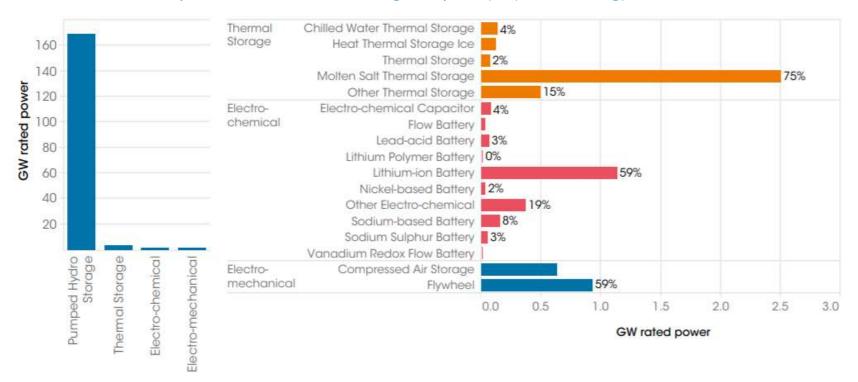

Comparison of footprint for a 800 MWhe storage Cyan = AMSES Dark Blue = Li -ion Battery Brown= CSP tower

## Global Scenario

#### Operational Power Storage Capacity by technology -mid 2017

## Recommendation

- > Thermal Storage- Effective for long term storage / discharge cycles than battery
- > May also be used for partial coal flexibility support.
- > Utilization of existing assets. Low space requirements- TG cycle reuse.
- > Guidelines for evaluating new technologies & implementing a pilot scheme

# **Ensure Cyber Security**

#### Attack Surface

#### INFORMATION TECHNOLOGY

IT includes virtual/online work and computer networks.

IT stores, retrieves, transmits, and manipulates data, mostly in the virtual world, using computer networks.

OT П Protect Protect the critical assets the data

#### **OPERATIONAL TECHNOLOGY**

OT includes hardware and software.

It is focused on moving and controlling devices and processes to keep systems working as intended, safely and efficiently.

© 2019, General Electric Company or its Affiliates. All rights reserved

DMZ: Demilitarized Zone; SCADA: Supervisory control and data acquisition

**\$500 Billion** total potential cost of cyber crime to the global community

Median number of days an attacker resides within a network before detection

3,800,000\$

**\$3.8 Million** average cost of a data breach to a company

1,000,000\$

Up to \$1 Million per day fine for NERC compliance violation

#### Ukraine Grid cyber attack

225K people lost power in the Ukraine from cyber attack (December 2015)

The attackers appear to have gained access more than **six months prior** the power outage occurred

**+30 Substation**, 3 utilities companies attacked

Impacted stations worked in operationally constrained mode after electrical service was restored Why should **YOU** care about cyber security?

There is a growing trend of using cyber attacks to target critical infrastructure and industrial systems...

## TRITON Saudi Arabia cyber attack

Attack goals was to **sabotage** the firm's operations and **trigger an explosion** 

Within minutes of the attacks, hard drives inside the company's computers were destroyed and their data wiped clean

First insertion without interrupting normal operation
First compromise of safety control system (SIS)

src: SANS Webinar - Anatomy of TRITON ICS Cyberattack

#### **NERC Enforcement: Duke Energy fined \$10M**

NERC fined Duke Energy \$10 Million for security violations between 2015 and 2018 regarding critical infrastructure assets

The 127 security violations, including critical cyber assets, were largely self-reported by the utility and caused by:

- Lack of managerial oversight,
- Process deficiencies.
- Inadequate training
- Lack of internal controls.

## Why should **YOU** care about cyber security?

...cyber security related policies have been established around the world and national entities are getting more and more serious into enforcing security standards!

© 2019, General Electric Company or its Affiliates. All rights reserved

#### **United Kingdom latest** announcement

New fines for essential services operators with poor cybersecurity as much as £17 million or 4 per cent of global turnover

NIS Directive will help make UK most secure place to live and do business online

For sophisticated organizations, pursue proactive and predictive security measures such as have a response plan & trained personnel to execute it during or after cyber events

Identify immediate security issues that can impact operations even if the environment is thought to be air-gapped. **ASSESS** Flexible & adaptable to customer needs **PROTECT PREVENT** 

Implement security monitoring and defensive layers to comply with standards and strengthen the security posture of a company.

## Recommendation

- ➤ Guidelines for protecting the generation & transmission assets by implementing -cyber security
- ➤ Develop & Implement Cyber security standards/ grid codes
